

# ACO DRAIN

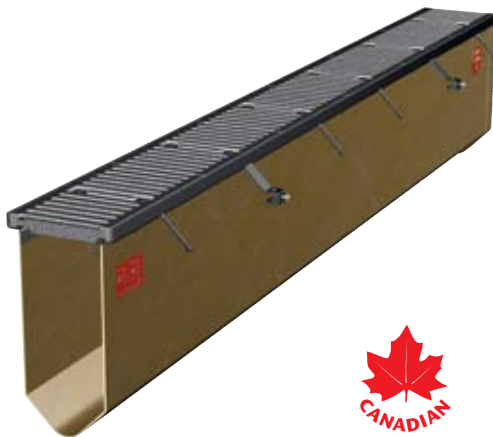

## Canadian Tire Eastern Distribution Centre Coteau du Lac

### ACO PORTFOLIO

**Product:**

***FG200 and ductile iron slotted grates***

While designing the docks at this new distribution center, the engineers wanted to maintain a flat surface so that trucks could safely and easily back up to the loading docks.

Area drains would not have been able to drain such large flat areas so a trench drains were required.

By using FG200, which comes in 9' lengths, contractors were able to install up to 600 feet per day helping speed up the project.

Load class E ductile iron slotted grates were used to with stand the frequent heavy semi-trailer trucks that would be driving and turning over the trench.
